

- ① Random Forest Classifier
- ② Random Forest Regressor

### Decision Tree

overfitting

prepruning

Low Bias  $\rightarrow$   
 High variance  $\rightarrow$  Post Pruning  
~~High Bias~~ ~~variance~~

overfitting

Low Bias

Pre pruning

High variance

Post pruning

## \* Bagging and Boosting :

① Bagging :- [Ensemble Technique]  
(Bootstrap Aggregation)

Technique

### Bagging of Algorithm

Problem Statement

ML 1

$D.T \Rightarrow 1$

ML 2

$SUC \Rightarrow 0$

ML 3

$logistic \Rightarrow 1$

ML 4

$D.T \Rightarrow 1$

ML N

$0$

$\therefore$  Final output =  $1 \Rightarrow$  Majority voting Classifier

\* In classifier  $\Rightarrow$  Based on majority voting

In Regression  $\Rightarrow$  Based on mean/Average

Example :-

KBC [Amitabh Bachan]

{ Krish → DATA SCIENCE

{ UPSC → Diversified ⇒ Multiple Domain

UPSC person can answer easily in KBC.

Ensemble Techniques

Final ⇒ A

Kaggle, HackerRank

Majority Voting

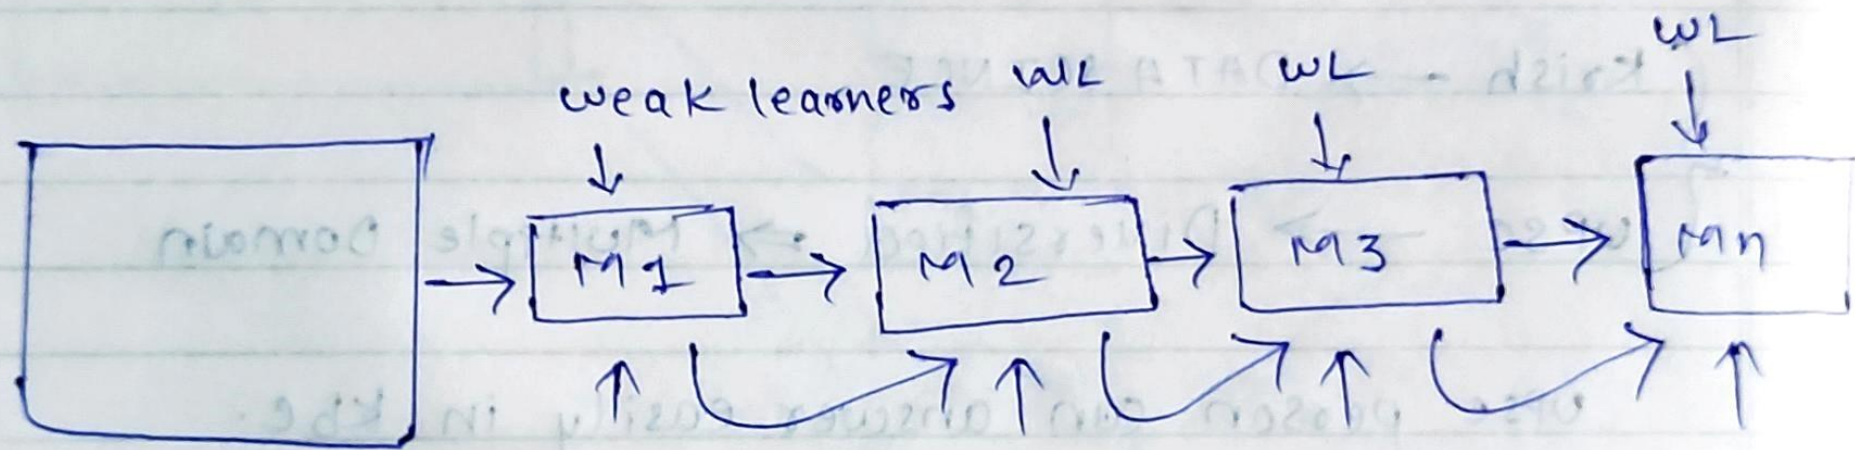

overperforming result

Teacher's Signature & Date : .....

for Regression we use mean instead of majority.

## ② Boosting :-

① AdaBoost Regressor and classifier

② Gradient Boost

③ xgboost → Extreme Gradient Boost

# Random forest classification and Regression:-

$$d_1 < d$$

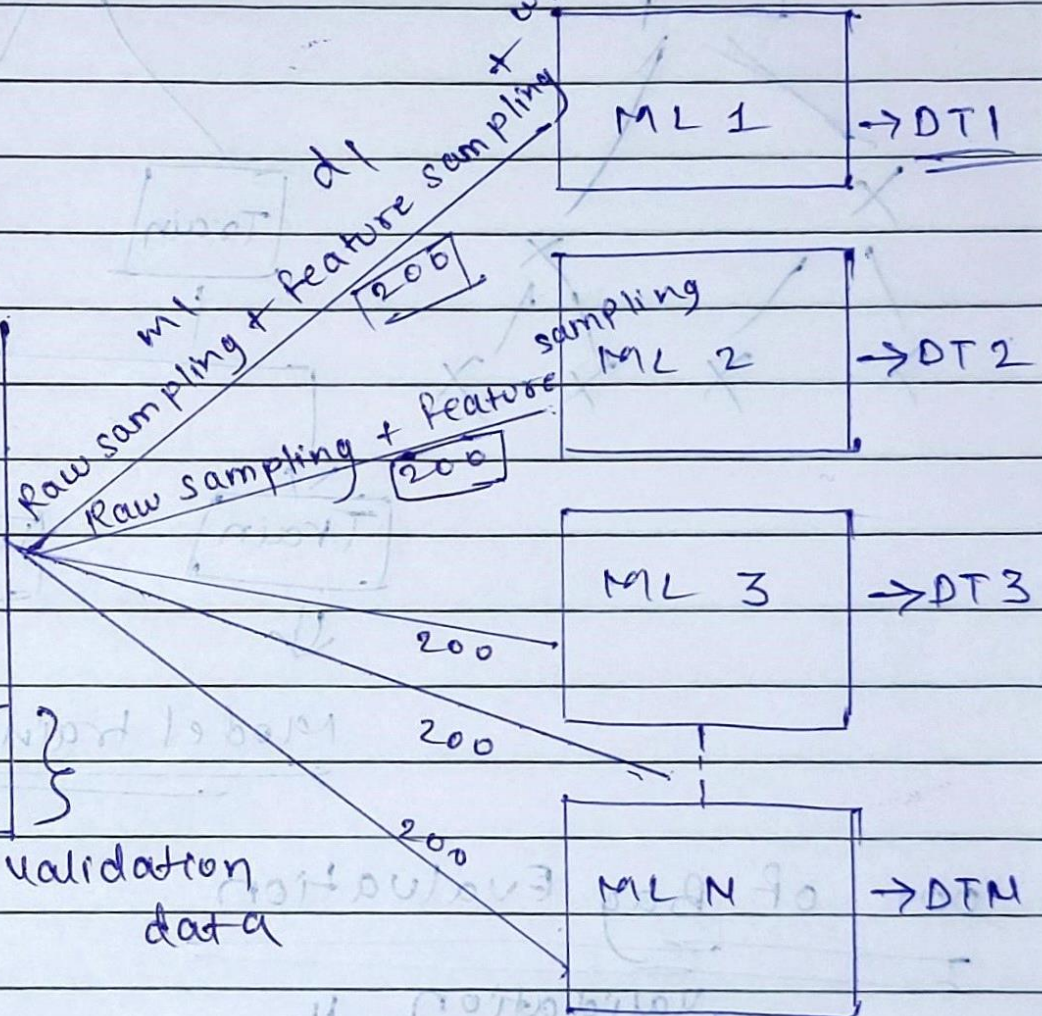

$$m_1 < m$$

m

validating

oob-score = True

DT<sub>1</sub> ⇒ overfitting ⇒ Pre pruning or post pruning  
 ⇒ cumbersome task

- ✓ ① Low Bias  $\Rightarrow$  Training
- ✓ ② High Variance  $\Rightarrow$  low variance
